

## **New time recording terminal from Spica**

LJUBLJANA, 1.12.2009 - **Spica International has recently enhanced its range of access and time recording terminals with the Zone Button, a new state-of-the-art peripheral device. It offers a modular solution for time recording, when connected to Spica's DOX range of intelligent controllers, especially useful where there is a requirement for both access control and time&attendance.**

The interface between the user and the device is enabled via a backlit display and four illuminated touch keys. In 'idle mode', the display shows date and time, while upon the user's arrival or departure, it can display a selection of user data, including the type of event, the new balance of hours various statuses and messages. The compact terminal has been designed with a built-in card reader (HID iClass).

As a bonus, there is the possibility of a direct connection to Ethernet, without the need for interface via a DOX controller. Eventually this product will be able to replace the existing DOG20 terminal as a stand-alone time recording device. This would provide ideal solution for time and attendance applications where there is no specific requirement for access control.

The new product, in conjunction with Spica's Time&Space software, completes the range of Spica solutions for access control and time recording.
